DAG (*Directed Acyclic Graph*) usando ou não *whitelisting* no algoritmo de aprendizado da estrutura da rede causal

DAG sem WL

DAG com imposição de uma WL

Distribuição marginal de probabilidades

```
fitted.1 <- bn.fit(bn1, s1)
fitted.2 <- bn.fit(bn2, s1)

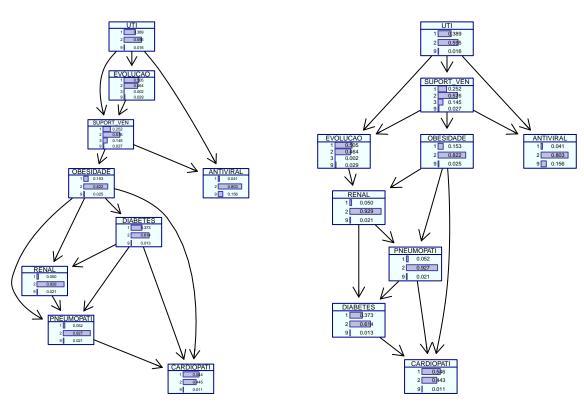

par(mfrow=c(1,2))
graphviz.chart(fitted.1,</pre>
```

```
type = "barprob",
    col = "darkblue",
    bg = "azure",
    bar.col = "darkblue",
    main = "DAG sem WL")

graphviz.chart(fitted.2,
    type = "barprob",
    col = "darkblue",
    bg = "azure",
    bar.col = "darkblue",
    main = "DAG com WL")
```

DAG sem WL

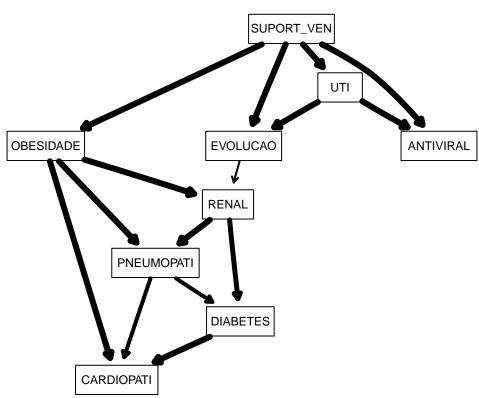

DAG com WL

Fase de Bootstrap

```
shape = "rectangle",
main = paste("Iter = ", boots.trap, thr))
```

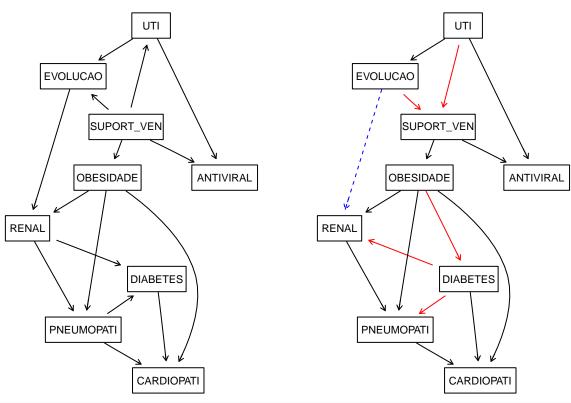

Iter = 300 Thr: 0.56

How can we compare the averaged network (avg.diff) with the network we originally learned in from all the data? The most qualitative way is to plot the two networks side by side, with the nodes in the same positions, and highlight the arcs that appear in one network and not in the other, or that appear with different directions.

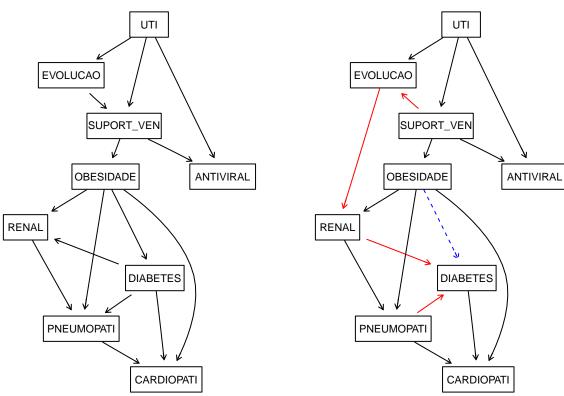

DAG médio sem WL

DAG médio com WL

DAG único sem WL

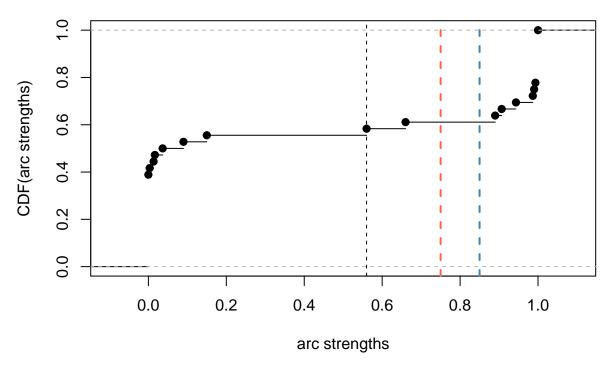

DAG único com WL

It is also a good idea to look at the threshold with respect to the distribution of the arc strengths

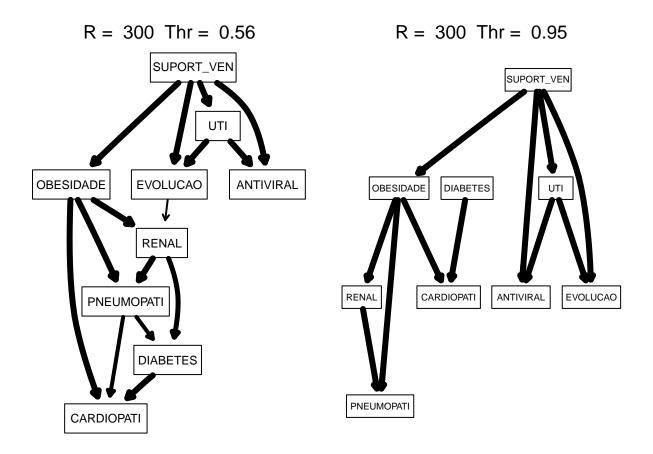

```
plot(str.diff)
abline(v = 0.75, col = "tomato", lty = 2, lwd = 2)
abline(v = 0.85, col = "steelblue", lty = 2, lwd = 2)
```

threshold = 0.56

The simpler network we obtain by setting threshold = 0.95 in averaged.network() is shown below; it is certainly easier to reason with from a qualitative point of view. Na figura abaixo R é o número de iterações usadas na fase de bootstrapping

```
avg.simpler = averaged.network(str.diff, threshold = 0.95)
par(mfrow = c(1, 2))
strength.plot(avg.diff,
              highlight = list((mb(avg.diff, 'EVOLUCAO'))),
              str.diff,
              shape = "rectangle",
              main = paste("R = ",
                           boots.trap,
                           " Thr = ",
                           attr(str.diff, "threshold")))
strength.plot(avg.simpler,
              highlight = list((mb(avg.simpler, 'EVOLUCAO'))),
              str.diff,
              shape = "rectangle",
              main = paste("R = ",
                           boots.trap,
                           " Thr = ",
                           #attr(avg.simpler, "threshold")))
                           0.95))
```

Markov Blanket da variável EVOLUCAO

```
cat (mb(x = avg.diff, node = 'EVOLUCAO'))

## RENAL OBESIDADE UTI SUPORT_VEN

##
cat (mb(x = avg.simpler, node = 'EVOLUCAO'))

## UTI SUPORT_VEN
